

Maritime Engineering

Maritime Engineering

Maritime Engineering is a Danish marine service and engineering company.

We offer reliable efficient service with high quality of workmanship.

Our experience is gained from projects performed for the world's leading shipping companies.

We provide multi-skilled teams of service engineers for repair, overhaul and installation assignments.

We specialise in carrying out our assignments during vessel service.

We minimise or completely eliminate interference with the vessel's schedule.

We retrofit products with modern green technologies to existing engines to help achieve a reduction in

emissions and costs whilst increasing efficiency.

We are partnering a project developing a green retrofit product for onboard handling of sludge which significantly reduces sludge waste.

Reliable Efficiency

Our teams of service engineers are ready to travel worldwide at short notice. We attend jobs with the right team, the right tools and thorough preparation to ensure none or minimal disruption to the vessel's normal service.

Alpha Service

We have retrofitted the Alpha Lubrication system on more than 100 vessels. This extensive experience has given us an intimate knowledge of the system and led us to develop on-site testing equipment for the recommended 32,000 hrs overhaul.

Our testing equipment allows us to performance test every single lubricator and to pinpoint any system deficiencies. A service ensures optimal performance.

Hydraulic/Piping

Our engineers are highly skilled at hydraulic/piping work, installation, repair and maintenance. We attend jobs on offshore installations, onboard vessels during voyages, port calls or docking.

Engine Overhaul

We carry out individual and fleet-wide engine overhauls. The complete overhaul is carried out onboard.

We offer complete solutions including parts, logistics, scheduling and overhaul. We use The latest Chris-Marine tools.
